BILATERAL DIGITAL SCREENING MAMMOGRAM:

CLINICAL HISTORY : Screening mammogram

COMPARISON(S) : None available

TECHNIQUE : Bilateral digital mammography was performed. CC and MLO views were obtained.

FINDINGS : There is an essentially symmetric heterogeneously dense pattern of fibroglandular tissue without new or dominant mass. No architectural distortion is seen. No malignant clusters of microcalcification are seen. The skin and nipple appear normal bilaterally. No pathologic axillary lymphadenopathy is seen. Benign calcifications noted bilaterally. Left chest wall pacing device.

IMPRESSION:

1. BI-RADS 2: Benign findings
2. Recommend monthly self-breast exam and annual screening mammography.

ACR Category 2 (B) Benign

- No abnormal or reportable findings.
- A negative x-ray report should not delay biopsy if a dominant or clinically suspicious mass is present. 4-8 percent of cancers are not identified by x-ray.
- Adenosis and dense breasts may obscure an underlying neoplasm.
- False positive reports average 6-10 percent.
